Divide the base of one loop of the curve into $(n + 1)$ equal parts, so that the angle equivalent to the linear distance between any two points of division will be $\frac{180}{n+1}$. The ordinate at the (x) -th point of $n + 1$ division will then be $180 \sin \frac{x}{n+1}$. If similar equations are formed for the ordinates at each point of division, there result n equations of the first degree, by means of which the constants, a, b, c, \dots , to n terms can be determined. The general solution for any pair of coefficients, such as a and b , takes the form $r = \frac{180}{n+1} (l + e^{iM(kmr)} + \dots - \sin(wv+i))$. The significance of these equations from the graphical standpoint can be seen by referring to Fig. 2, which represents in polar coordinates the curve of Fig. 1. Here the original $(n + 1)$ equal linear divisions are replaced by the $(n + 1)$ equal angular divisions...
